

**Organic Electronics 1, 6.0 credits**

Organisk elektronik 1, 6.0 hp

Third-cycle education course

6FITN02

Department of Science and Technology

Valid from: First half-year 2024

**Approved by**  
The Board of PhD Studies

**Approved**  
2024-02-28

**Registration number**

## Entry requirements

Basic skills in modern physics (primarily solid state physics), mathematics and electronics. Basic chemistry is useful but not a formal requirement. TNE024 Molecular Physics is recommended, especially for students who also intend to follow Organic Electronics 2.

Admitted to studies at postgraduate level.

## Learning outcomes

After finishing the course, the students should be able to:

- explain charge transport, energy levels, and doping in organic electronic materials, and how they compare to metals and inorganic semiconductors
- exemplify specific organic electronics materials, their properties, and applications
- summarize the optical properties and applications of organic electronic materials, such as in displays and photovoltaic systems
- exemplify the architecture, characterization, and utilization of electronic components based on organic electronic materials (such as conductors, resistors, capacitors, diodes, transistors)
- determine fundamental parameters for the above mentioned components, and explain how these parameters influence the performance of the components
- summarize the electrochemical properties of organic electronic materials, and their applications in devices and systems
- explain and motivate the use of organic electronic materials in biological applications
- summarize device fabrication techniques, especially related to “printed electronics”
- compare commercial applications for organic electronics, and summarize the current market.

## Contents

Course lectures will cover topics such as: introduction to organic electronic materials and their basic properties; charge transport and energy structure of organic electronics; case-studies on specific materials used in current research; optical properties (energy levels, color changes, light emission and absorption); organic electronic circuit components (conductors, resistors, capacitors, diodes, transistors); electrochemistry of organic electronic materials, and applications of redox properties; organic bioelectronics (motivation, applications in neuroscience and plant biology); printed electronics (methods, inks, applications); organic electronics photovoltaics (measurement techniques, solar cells); an overview of current applications and commercialization (cost, implementation, environmental consideration).

The discussion sessions (lektioner) will cover the topics above, in a more open discussion format.

### **Educational methods**

Lectures and discussion sessions.

### **Examination**

Written examination

### **Grading**

Two grade scale, older version

### **Course literature**

Articles

### **General information**

#### **Education components**

Preliminary scheduled hours: 36 h

Recommended self-study hours: 124 h
